Frequency data sheet

Count every time the behavior happens during each observation. Write the start and end time so you can turn the count into a rate.

Learner / student _____ Observer _____ Setting _____

Behavior and definition (what counts as one occurrence, when one ends): _____

#	Date	Start	End	Minutes	Tally	Count	Rate per min

Rate per minute = count ÷ minutes observed. Example: 12 occurrences in 30 minutes is 0.4 per minute (or 24 per hour). Compare rates, not raw counts, when observations differ in length. Only count behaviors that have a clear start and end and do not last long; for behaviors that go on for a while, use a duration sheet.
